

New biofouling regulations in Brazil

Vessels above 24 meters in length that enter Brazilian waters are required to arrive with a 'clean hull' or perform in-water hull cleaning. Similar restrictions apply to vessels operating between domestic marine biogeographic regions.

Protecting Brazil's marine and coastal biodiversity

In June 2025, the Brazilian authorities amended [NORMAM-401/DPC](#), its regulations for preventing vessel discharges to water, adding a separate section on biofouling management. The new regulation aims to ensure the safety and sustainability of Brazil's maritime ecosystems and human activities by further reducing the likelihood of vessels introducing invasive aquatic species into its waters.

To protect the various unique and important ecosystems along Brazil's long coastline, the new regulation also defines three domestic marine biogeographic regions (see image below) and imposes additional biofouling requirements on vessels that travel between them.

Arriving in Brazil with a clean hull

According to our local correspondent Representações Proinde Ltda., Brazil's new biofouling management regulation aligns with the IMO 2023 Biofouling Guidelines ([MEPC.378\(80\)](#)). It applies to vessels above 24 meters in length and affects both vessels entering Brazilian waters and vessels that transit between the domestic biogeographic regions, requiring such vessels to:

- Implement a vessel-specific Biofouling Management Plan and Biofouling Record Book compliant with the IMO guidelines.
- Maintain a clean hull – where 'clean' means no biofouling apart from a slime layer (microfouling) and a very small amount of visible fouling species (macrofouling). This corresponds to a fouling rating number of 1 or lower as defined by Annex J of the regulation.
- Schedule a hull cleaning if there is excessive fouling. In-water hull cleaning in port must be requested at least 10 days prior to arrival, using the application form found in Annex K of the regulation.

Key terminology

Biofouling is the accumulation of aquatic organisms such as microorganisms, including pathogens, plants and animals on surfaces and structures immersed in or exposed to the aquatic environment.

Fouling rating is the allocation of a number for a defined inspection area of the ship surface based on a visual assessment, including description of biofouling present and percentage of macrofouling coverage.

In-water cleaning is the removal of biofouling from a ship's hull and niche areas while in the water.

Invasive aquatic species are non-native species to a particular ecosystem which may pose threats to human, animal and plant life, economic and cultural activities and the aquatic environment.

Microfouling is biofouling caused by bacteria, fungi, microalgae, protozoans and other microscopic organisms that creates a biofilm also called a slime layer.

Macrofouling is biofouling caused by the attachment and subsequent growth of visible plants and animals on structures and ships exposed to water. Macrofouling is large, distinct multicellular individual or colonial organisms visible to the human eye such as barnacles, tubeworms, mussels, fronds/filaments of algae, bryozoans, sea squirts and other large attached, encrusting or mobile organisms.

trading to or within Brazilian waters are advised to take note of the above changes and update onboard procedures accordingly, taking advice from IMO guidelines on biofouling management ([MEPC.378\(80\)](#)) and in-water cleaning ([MEPC.1/Circ.918](#)). It is also worth noting that Brazil defines its “internal waters” as its internal waters, the territorial sea and exclusive economic zone (EEZ), to a distance of 200 nautical miles from baselines along with waters overlying the extended continental shelf.

A detailed map of Brazil illustrating its biogeographic regions and drainage basins. The map is color-coded to show different biogeographic regions: Northern Biogeographic Region (green), Northeast Biogeographic Region (yellow), and Southeast South Biogeographic Region (blue). Major drainage basins are outlined in white and labeled, including the Amazon basin (Bacia da Foz do Amazonas, Bacia Pará-Maranhão, Bacia do Tocantins, Bacia do Araguaia, Bacia do Parnaíba, Bacia do São Francisco, Bacia do Atlântico Leste, Bacia do Atlântico Sul, Bacia do Paraná, Bacia do Uruguai, Bacia do São Paulo, Bacia do Rio de Janeiro, Bacia do Espírito Santo, Bacia do Rio Negro, Bacia do Rio Grande, Bacia do Rio São Francisco, Bacia do Rio São João, Bacia do Rio São Marcos, Bacia do Rio São Mateus, Bacia do Rio São Miguel, Bacia do Rio São Paulo, Bacia do Rio São Sebastião, Bacia do Rio São Vicente, Bacia do Rio São Xavier, Bacia do Rio São Zé, Bacia do Rio São João, Bacia do Rio São Marcos, Bacia do Rio São Mateus, Bacia do Rio São Miguel, Bacia do Rio São Paulo, Bacia do Rio São Sebastião, Bacia do Rio São Vicente, Bacia do Rio São Xavier, Bacia do Rio São Zé). State abbreviations are also visible across the map.

Biofouling management outlook

An international convention will provide a unified framework for addressing biofouling management globally and help avoid the patchwork of national regulations that can be impractical for the industry. It will also help ships gain access

to in-water cleaning in more places than today. Meanwhile, the following Gard articles may be of interest:
